

What happens when you specify `RegexOptions.ECMAScript`?

 devblogs.microsoft.com/oldnewthing/20040916-00

September 16, 2004

Raymond Chen

The `RegexOptions.ECMAScript` flag changes the behavior of .NET regular expressions. One of the changes I had discussed earlier was with respect to matching digits. For those who want to know more, a summary of the differences is documented in MSDN under the devious title “ECMAScript vs. Canonical Matching Behavior”.

Apparently some people had trouble finding that page, so I figured I’d point to it explicitly.
