

How do I suppress full window drag/resize for just one window?

A customer asked,

Is there a way to turn off Full Window Drag on a single window? I have a resizable control that I would like not update itself while resizing.

It so happens that I wrote a sample program ages ago to illustrate how to do this. You can find it in the Platform SDK under `winui\fulldrag`. The source code is also reproduced in [this Knowledge Base article](#).

In addition to deferring painting, you may also want to defer layout if layout is expensive for your window.
