

131 Spamware Extensions Targeting WhatsApp Flood Chrome Web Store

[← Back](#)

ResearchSecurity News

The Socket Threat Research Team uncovered a coordinated campaign that floods the Chrome Web Store with 131 rebranded clones of a WhatsApp Web automation extension to spam Brazilian users.

This cluster of Chrome extensions comprises 131 rebrands of a single tool, all sharing the same codebase, design patterns, and infrastructure. They are not classic malware, but they function as high-risk spam automation that abuses platform rules.

The code injects directly into the WhatsApp Web page, running alongside WhatsApp's own scripts, automates bulk outreach and scheduling in ways that aim to bypass WhatsApp anti-spam enforcement. Listings and marketing sites claim that their Chrome Web Store presence implies a rigorous audit and full privacy compliance. That claim is inaccurate and conflicts with Chrome and WhatsApp policies. At the supply chain level, this is policy abuse that enables spam at scale. Across listings with visible counts, these extensions account for at least 20,905 active users.

All 131 extensions were live in the Chrome Web Store at the time of writing. We have filed takedown requests with the Chrome security team and requested suspension of the related publisher accounts for [policy](#) violating spamware.

▲ **Known malware** ↗

Package and version (1)

mnbdaobmkglnmiagimcniebbgebabek@2.19.29

Instance	Details
Instance #1	Id 586613
Instance #2	Note This Chrome extension is part of a large-scale commercial spam-automation campaign; while not classic malware, it functions as policy-abuse infrastructure that violates Chrome Web Store spam policies and WhatsApp anti-spam rules, enables bulk sending and scheduling via WhatsApp MAIN-world hooks, and exfiltrates media off-device despite marketing that minimizes or misrepresents these behaviors.
Alert Locations	
src/core/domObserver/index.js	

Socket AI Scanner flags the Chrome extension [mnbdaobmkglnmiagimcniebbgebabek](#) (Organize-C) as malware due to spamware behavior: it injects code into the WhatsApp Web page to automate bulk messaging and scheduling, violates Chrome Web Store and WhatsApp policies.

Gaming the Store#

Based on Chrome Web Store timestamps and our captures of the 131 unique listings (see IOCs), the operation has run for at least nine months. Rebrands and updates landed in regular waves throughout 2025, with new uploads and version bumps observed as recently as October 14, 2025.

CRM para WhatsApp Web

Overview

CRM para WhatsApp Web

Chrome Web Store listings, top to bottom: [YouSeller](#) (10,000 users), [performancemais](#) (239 users), and [Botflow](#) (38 users). Each shows the same WhatsApp Web automation interface, consistent with a spamware clone cluster that reuses design, imagery, descriptions, and codebase. Note: the “users” metric reflects active users, not total installs.

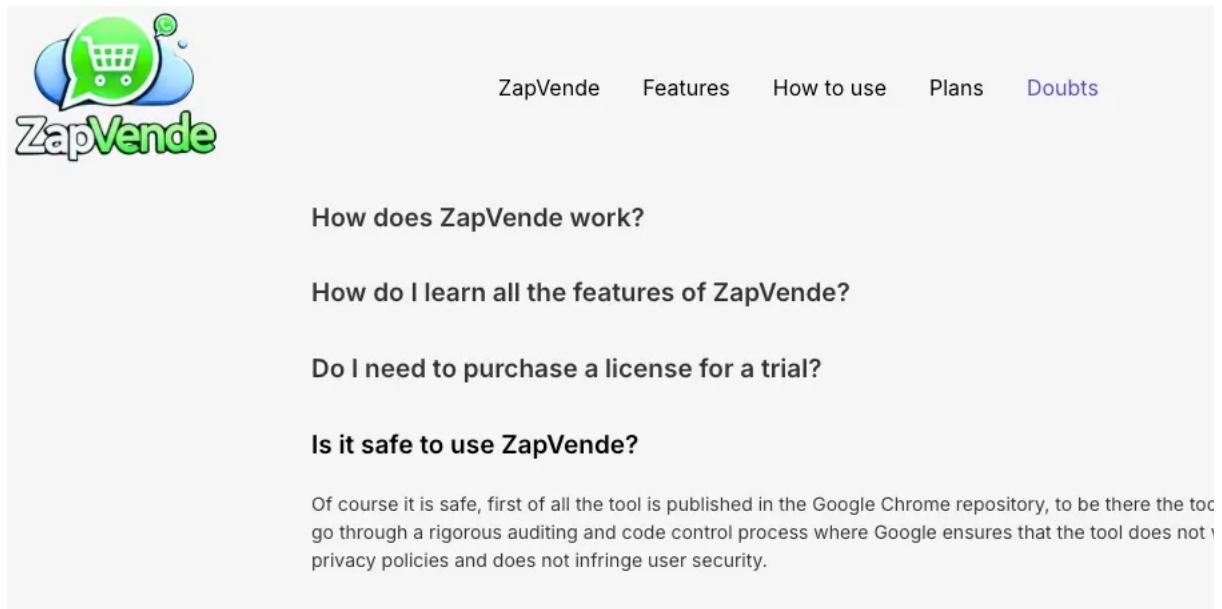

Extensions use different names, logos, and glossy landing pages, but the code and infrastructure are the same. The dominant publisher label is WL Extensão and its variant WLExtensao, which appears on 83 listings. Despite the varied branding, the entire cluster was published through only two developer accounts: `suporte@grupoopt.com[.]br` and `kaio.feitosa@grupoopt.com[.]br`. The features look business facing, but the operational goal is aggressive outbound messaging that aims to evade WhatsApp rate limits and anti-spam controls.

Marketing Strategy#

It is akin to a franchise model: the operator and affiliated sellers publish dozens of near identical copies under new names and logos, then promote them with lookalike sites that sell monthly plans and pitch investment benefits in

Portuguese to Brazilian small businesses. Many of these sites claim that Chrome Web Store inclusion means a rigorous audit and code review that guarantees privacy and safety. Chrome's process is a policy compliance review, not a certification, and presenting it as an audit misleads buyers and creates a false sense of security.

For clarity, screenshots in this post include translations from Portuguese to English.

[ZapVende](#), one of the extensions in this cluster, is marketed at [zapvende\[.\]com](#), which asserts the extension is safe simply because it is in the Chrome Web Store.

DBX Tecnologia (DBX Technology Group), the operator of the original extension that spawned 131 clones, markets a reseller program. DBX Tecnologia and Grupo OPT, which operates the [grupoopt\[.\]com\[.\]br](#) domain, are effectively two arms of the same business under the same founder, not unrelated companies. Both [describe](#) their work as an ecosystem that builds WhatsApp-based solutions, among other products.

DBX Tecnologia reseller white-label program: invest R\$12,000 (~USD \$2,180) to rebrand and sell its WhatsApp Web extension under your own name, with promised 30 to 70 percent margins and R\$30,000 to R\$84,000 (~USD \$5,450 to ~USD \$15,270) in recurring revenue, illustrating the “franchise model” behind the 131 clone flood.

Based on the DBX Tecnologia YouTube [pitch](#), a “white-label partnership” means that:

- DBX supplies the product, the partner supplies the brand. The partner pays an upfront fee to license the WhatsApp Web automation extension, DBX swaps in the partner's logo, name, some design features, and provides marketing assets and tutorials.
- The partner publishes and sells it as if it were their own tool.

- DBX maintains the core code and backend. The partner's branded build still communicates with DBX-controlled services when features are used, and receives updates from the same codebase.
- Revenue flows to the partner minus DBX program fees or revenue share. DBX advertises high margins and recurring income because partners resell subscriptions to end customers.

Practical caveats: if listed as a publisher, the partner carries policy and reputational risk. Bulk messaging with spam scheduling collide with WhatsApp's opt-in rules and Chrome Web Store spam and duplication policies, so partners and their customers face takedowns and account bans. If features route media to vendor infrastructure, the partner must disclose that data flow and provide a privacy policy.

Distribution Infrastructure#

[Lobo Vendedor](#) is marketed at `lobovendedor[.]com[.]br`, one of at least 23 near-identical sites we found that promote individually branded clones of the same extension. Many of the extensions are also backed by matching YouTube, LinkedIn, Instagram, and TikTok accounts that funnel buyers into subscriptions.

The pitch centers on aggressive outreach at scale on WhatsApp, with automation, templates, and scheduling that maximize reach. This reseller strategy multiplies distribution, and it steers customers toward conduct that violates Chrome Web Store rules on duplicate and spammy extensions and WhatsApp's requirement for recipient opt-in. The impact lands on ordinary users, who receive unsolicited promotional messages at volume, and the burden of defense shifts to recipients who must block numbers and report abuse after the fact.

Lobo Vendedor marketing page (lobovendedor[.]com[.]br) promotes a rebranded clone of the WhatsApp Web automation extension, resc. The site illustrates the reseller model driving this clone cluster and pushes mass messaging that conflicts with WhatsApp's opt-in rules.

Chrome Web Store Policy in Context#

Google's Chrome Web Store Spam and Abuse [policy](#) bans developers and their affiliates from submitting multiple extensions that provide duplicate experiences. It also prohibits manipulating placement through ratings or installs, blocks extensions that send spam or unwanted messages, and forbids sending messages on a user's behalf without giving the user a chance to confirm the content and recipients. These rules map directly to our findings: the cluster consists of near identical copies spread across publisher accounts, is marketed for bulk unsolicited outreach, and automates message sending inside web.whatsapp.com without user confirmation.

The screenshot shows the Chrome Web Store's 'Spam and Abuse' policy page. The header includes the 'chrome for developers' logo and navigation links for 'Docs', 'Case studies', 'Blog', and 'New in Chrome'. The breadcrumb trail reads 'Chrome Extensions > Chrome Web Store - Program Policies'. The main heading is 'Spam and Abuse', with a link to 'View single page version'. A list of five policy points is visible, detailing prohibitions on duplicate experiences, manipulation of placement, sending spam, and unauthorized messaging. The text is partially cut off at the bottom.

Spam and Abuse

[View single page version](#)

1. We don't allow any developer, related developer, or publisher to submit multiple extensions that provide duplicate experiences or functions through the creation of unique content or branding.
2. Developers must not attempt to manipulate placement through ratings or installs, but is not limited to, inflating prices, fraudulent or incentivized downloads, or other manipulative practices.
3. We do not allow extensions that abuse, circumvent, or interfere with the user interface, including promotions, phishing attempts, or unwanted messages.
4. We don't allow extensions that send messages on a user's behalf without giving the user a chance to confirm the content and intended recipients.
5. In addition to these requirements, all extensions must comply with applicable laws and regulations.

For additional information about the spam policy, see the [Spam and Abuse policy](#).

Chrome Web Store Spam and Abuse [policy](#), which the clone cluster violates by publishing duplicate experiences and by enabling spam extensions.

WhatsApp Business Policy in Context#

WhatsApp's Business Messaging [policy](#) requires explicit opt-in before a business contacts a person, places the burden of proving that opt-in on the sender, and mandates fast honoring of block and opt-out requests. It also instructs businesses not to deceive, mislead, or spam and to comply with applicable laws. The extensions in this cluster are marketed for bulk outreach and ban evasion, not consent-driven conversations.

WhatsApp Business Messaging policy requires opt-in and forbids spam or surprise messaging.

Contrary to WhatsApp's Business Messaging policy, the operators publish tutorials that teach circumvention rather than consent-based use. In a YouTube [video](#) by DBX Tecnologia, the author describes how to avoid bans by shaping traffic, for example tuning send intervals, pauses, and batch sizes, and by using templates that vary message text to reduce detection.

The goal is to keep bulk campaigns running while evading anti-spam systems. This marketing aligns with what we verified in code: document-start injection into WhatsApp Web, use of `window.WPP.*` helpers for message dispatch, and scheduled send logic via a Manifest V3 service worker. Together, the video and extension UI corroborate our assessment that the product is built to automate bulk messaging and to tune sending patterns in ways that aim to avoid WhatsApp anti-spam enforcement.

In a YouTube [tutorial](#), the author demonstrates the extension's bulk-send screen, showing controls for send intervals, pauses, and batch .

Outlook and Recommendations#

This campaign demonstrates policy abuse at scale that looks and behaves like a software supply chain, a single codebase cloned, lightly rebranded, and resold through affiliates. The commercial wrapper, storefronts, social channels, and tutorials, normalizes spamming that violates Chrome Web Store and WhatsApp rules. The result is wide reach, continuous re-uploads, and durability against takedowns.

Socket can turn these findings into detection and control. Use Socket's [Chrome extension protection](#) to inventory every extension in use, surface permissions and host access, and block risky updates before they land on endpoints. The same analysis engine that flags supply chain risk in open source packages now scans hundreds of thousands of extensions and alerts on behaviors such as excessive permissions, unexpected page access, and data exfiltration.

Fold Socket into existing guardrails. Enforce allowlists in Chrome Enterprise, restrict installs to approved extension IDs, and track permission creep over time. Pair Socket's visibility with network policy for egress control, then watch for lookalike domains as operators rotate infrastructure.
